How do box turtles lay eggs

Eggs of diurnal turtles are laid in the top of the nest. The turtle's body is exposed to temperature change, so it can become warm. The eggs are incubated for 8 to 9 months. The temperature changes help the development of the embryo. The turtle's body is exposed to temperature change, so it can become warm. The eggs are incubated for 8 to 9 months. The temperature changes help the development of the embryo. The turtle's body is exposed to temperature change, so it can become warm. The eggs are incubated for 8 to 9 months.
